

Installation Instructions ProTect Cable Strap

- 1) Remove the Flange nut. Install around the cables.

- 2) Replace the Flange nut. Tighten until sufficient tension is achieved.

- 3) **Important:** Do not over tighten the strap. The liner should be in contact with the cables but does not need to be so tight that the cables bulge at either side of the liner.

Please note: Thread galling is a known phenomenon which can occur when using stainless steel fasteners. A breakdown in the material's protective oxide layer results in the set screw and nut becoming welded together. To reduce the incidence of thread galling excessive pressure and speed should be avoided during installation. Thread lubricants can also be used at the point of application if problems are experienced - please contact Ellis Patents for further information.
